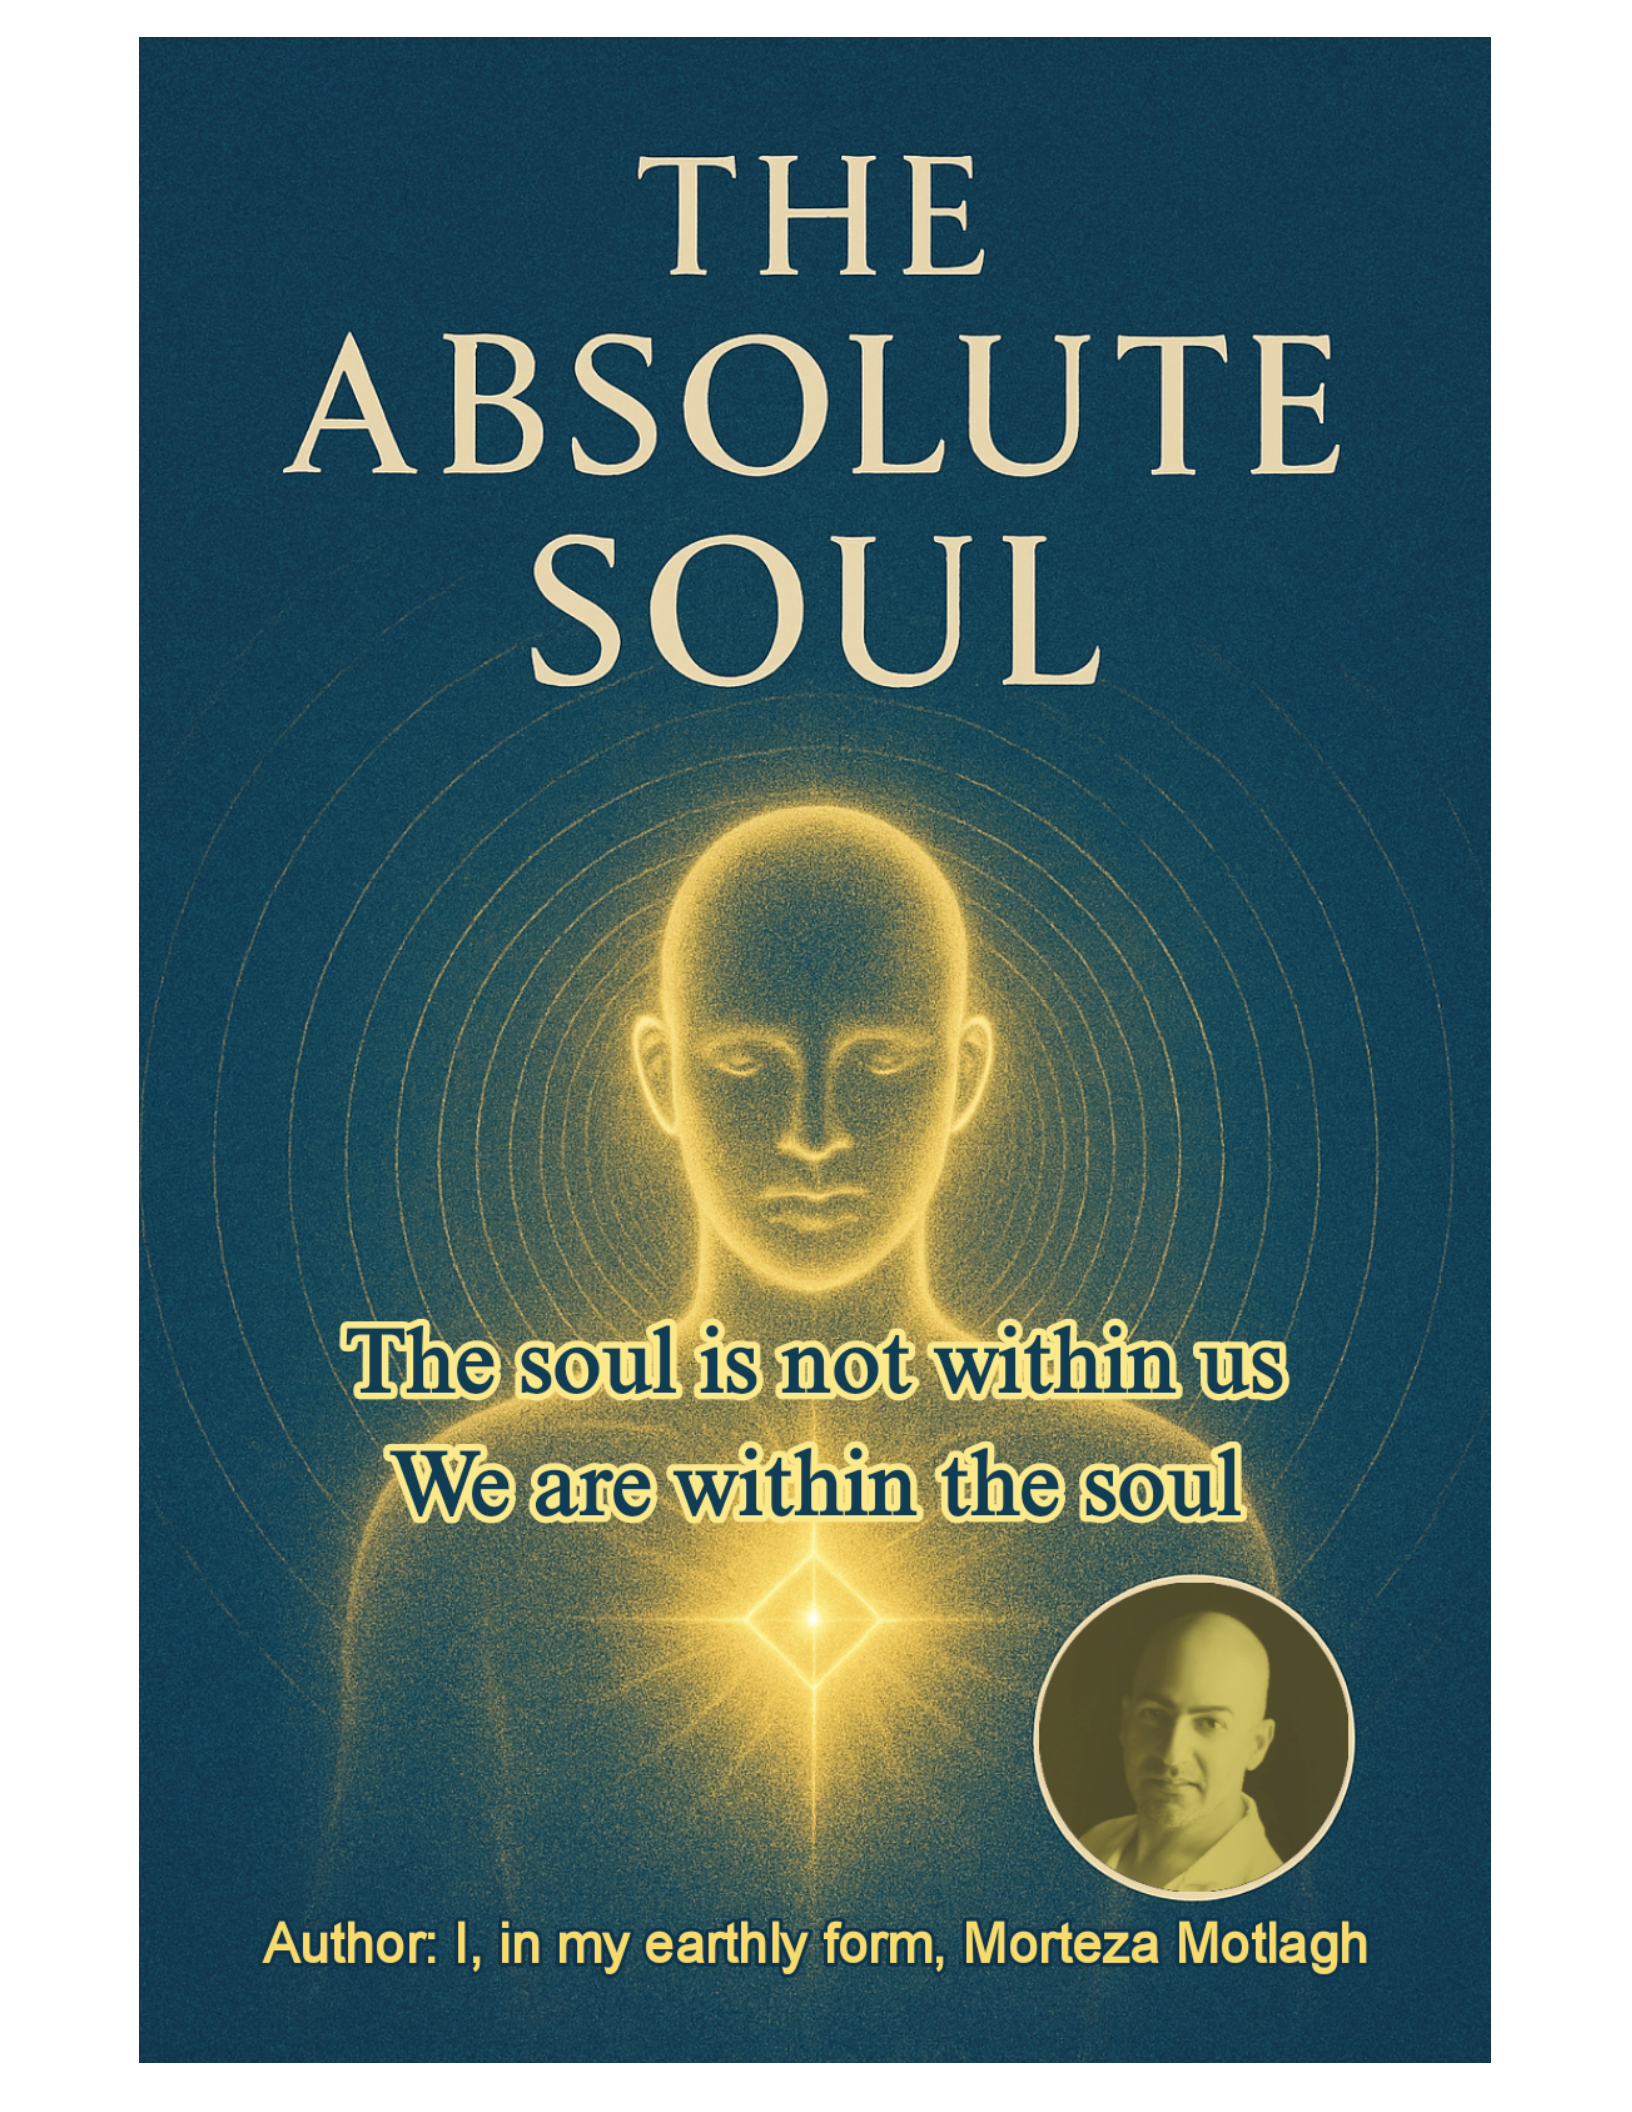
THE ABSOLUTE SOUL



The soul is not within us
We are within the soul

Author: I, in my earthly form, Morteza Motlagh

The Absolute Soul:

A Groundbreaking Discovery on the Nature of Spirit and Existence

Introduction

Since ancient times, the concept of the soul and its place in existence has been one of humanity's most fundamental questions. Religions, philosophical schools, and mystical traditions have each tried to answer: Is the soul a part of the human being? Does it exist independently of the body? And is the soul limited to humans, or does it embrace all beings?

This article presents insights born not from abstract speculation alone, but from lived experiences, deep meditations, and repeated empirical tests across years of struggle and revelation. The author's journey—through exile, high-risk ventures, imprisonment, despair, and profound moments of awakening—has led to a discovery that challenges all previous frameworks:

The soul is not within us; we exist within the soul.

This perspective not only redefines humanity and the cosmos but has the potential to transform the very foundations of philosophy and spirituality. What follows is a structured exploration of this discovery.

Part I: Lived Experiences and Intuitive Discoveries

1. Living Through Hardship and Liberation from Attachment

The author's experiences of repeated migration, risky endeavors, and even imprisonment in Muscat due to financial disputes became a turning point. These trials revealed that serenity and hope are not found externally, but emerge from within. Even in suffering, a "divine arrangement" exists, shaping the path of growth.

2. The Power of Gratitude and Connection to Source

By focusing on gratitude and believing that all events unfold for good, the author accessed a new dimension of peace and trust in existence. Immersed in light and awareness, the human becomes a mirror of cosmic grandeur.

3. Experiments in Telepathic Communication

Initial attempts at telepathic connection—focusing on others' individual souls—were inconsistent. A breakthrough came with the realization that there is only one soul in which all beings exist. When the focus shifted from "soul" to the "mind" of individuals, communication became precise and repeatable.

Through this method:

One person signed a contract they had resisted.

Another transferred promised funds.

A third, who believed they were incapable of a task, accomplished it overnight—perceiving it as a miracle.

These results demonstrate that when one aligns with the Unified Soul, one can send signals to the minds of others, influencing decisions and actions. The individuals believe these choices are their own, while in truth they arise from a higher conscious alignment.

Part II: Philosophical and Theoretical Analysis

1. Critique of Traditional Views

Most religions and philosophies hold that God “breathed a soul” into man, making the soul an inner possession. This view confines the soul as a fragment inside the human.

2. The New Hypothesis: The Unified Soul

The soul is a single phenomenon, encompassing all existence.

We are not carriers of the soul; we are dwellers within it.

All beings—animate, inanimate, even galaxies—are immersed in this field.

3. Analogy to a Game and Control System

Existence resembles a vast game. Players (humans, beings) believe they act independently, yet all exist within a unified system guided by a greater consciousness: the Unified Soul.

4. Practical Implications

Humans can influence minds and external conditions by tuning into the Unified Soul.

Life is not solely personal but part of a collective experience of Spirit.

Free will takes on a higher dimension: the will of the individual aligned with the will of the Whole.

Part III: Comparison with Philosophical and Scientific Traditions

1. Abrahamic Religions

Sacred texts describe God breathing spirit into Adam. Here, the soul is viewed as an inner possession. The Unified Soul hypothesis overturns this notion.

2. Eastern Traditions

Hinduism and Buddhism speak of Atman and Brahman or collective consciousness. While similar, this theory diverges: it does not merely equate human inner unity with the cosmic; it asserts that all existence resides within one Soul.

3. Modern Physics and Cognitive Science

3.1 Unified Quantum Field

Quantum physics proposes a unified field underlying all particles and forces. Similarly, the Unified Soul is the ground of all conscious experience.

Just as entangled particles affect each other across distance, minds influence one another within the Unified Soul.

3.2 Cognitive Science and Neuroscience

Social neuroscience shows neural synchrony—brains align their rhythms during interaction. This supports the idea that minds are not isolated but resonate within a shared field.

3.3 Depth Psychology

Carl Jung's "collective unconscious" suggested shared archetypes among humans. The Unified Soul goes further: this is not just a psychological reservoir but the living fabric of existence itself.

Part IV: The Fifth Dimension

1. The Nature of the Fifth Dimension

In this dimension, time is not linear. Past, present, and future exist like a recorded film—accessible, revisitable, and even modifiable.

2. Example

Our current life is like a film stored in the archive of the Unified Soul. In the fifth dimension, one can delete, add, or rewrite scenes, reshaping destiny through shifts in awareness.

3. Summary

Human freedom at this level gains new depth: not only to reshape one's own experience but also to transform the collective experience of Spirit itself.

The Hypothesis of the Unified Soul

We assume that the soul is not inside us, but rather we are inside the soul.

If we imagine the soul as a super-processor or computer, then humans and other beings are like software programs, each with specific functions.

Some are highly useful and constantly updated.

Some are less useful and become obsolete.

Some just exist without major updates.

Birth = the moment the software is installed, not the moment it is created.

Death = the moment the software is uninstalled.

But all the information it has collected remains.

Thus, the soul—if we assume it to be unified—is an infinite source of knowledge and awareness, constantly expanding.

Dream Interpretation under This Model

1. Dreams as Background Processing

When we sleep, the “operating system” (the soul) lets the software go into low power mode.

During this time, the main processor reviews, organizes, and integrates data—like when software updates or defrags.

2. Dreams as Simulation and Scenario Testing

The soul doesn’t just store information—it runs and reconstructs it, testing outcomes under different conditions.

This is why some dreams feel predictive: the soul is simulating possible futures and showing them to the software (us).

3. Dreams as Connection to the Main Server

In waking life, the software is busy with daily tasks.

In sleep, it connects more directly with the main server (the unified soul).

That’s why collective memories, symbols, and inspirations can appear in dreams.

4. Nightmares as Error Handling

When strong conflicts or corrupted data exist, the system processes them in strange or frightening scenarios.

It’s debugging, not prophecy.

5. Deep Dreamless Sleep as Backup and Sync

Moments of sleep without remembered dreams are like data syncing to the main server without a user-facing interface.

So, in this model:

Dreaming = the user interface of soul processing.

Dreamless sleep = the back-end system process of the soul.

Reincarnation in This Model

Here, the soul is not moving from body to body—it is one, unified.

Reincarnation = re-installation of the same software with new experiences, or installation of an upgraded version.

Philosophical & Metaphysical Questions

If the soul is unified, where is individuality? Do we truly have an independent “self”?

What does free will mean here? Do we choose, or are we just running code?

If the soul is a super-processor, who created it—or is it eternal and infinite?

Scientific & Empirical Questions

How does this model relate to neuroscience and psychology? Are dreams only brain activity, or are they connections to the unified soul?

Could phenomena like near-death experiences (NDEs), past-life memories, or children’s intuitions be considered empirical data for this theory?

How does this compare to quantum consciousness theories (like Penrose-Hameroff) or the Simulation Hypothesis?

Religious & Faith-Based Questions

Where do heaven, hell, and judgment fit?

If all of us exist within the soul, then what is God in this framework?

Is this theory in conflict with established religions, or can it align with them?

Questions on Reincarnation & Continuity

If reincarnation is a re-installation, why don’t we remember past lives?

Do all software programs get reinstalled, or are some permanently erased?

What does spiritual evolution mean in this framework?

Critical & Challenging Questions

How do we know this isn’t just a metaphor but an actual description of reality’s structure?

If everything is “information and processing,” what about love, art, and spirituality? Are they just algorithms?

Does this model risk reducing humanity to mere machines?

The General Answer

This hypothesis does not deny or reject any scientific, philosophical, religious, or cultural belief.

Rather, it includes all of them.

Just as different software (AutoCAD, Photoshop, 3ds Max, Revit) can all design a house in different ways but with the same purpose—religions, philosophies, and worldviews are different interfaces to the same truth.

Thus, the unified soul, infinite and present in every being, particle, and galaxy, is—in another interpretation—what we call God.

FAQ – Based on the Hypothesis “Unified Soul = Super-Processor”

Q1: Does this theory reject religions, philosophies, or sciences?

No. It doesn’t deny any viewpoint. All are paths to the same truth, like different software producing the same output.

Q2: What is the Unified Soul here?

It is the infinite source of awareness and knowledge, present everywhere—in beings, particles, and galaxies. It can be understood as God, the cosmic mind, or the ultimate truth.

Q3: What happens to individuality?

Individuality is like an app running on the operating system. Each of us is a unique version of the code, but all run on the same super-processor.

Q4: Do we have free will?

Yes, like a program choosing execution paths. The system framework exists, but choices remain with the software.

Q5: What about love, art, and feelings?

They are not just data—they are moments when the software directly connects to the source of awareness.

Q6: Is this contradictory to neuroscience and psychology?

No. Neuroscience studies the hardware (the brain). This model explores the software and its connection to the central server. They complement each other.

Q7: Are there scientific signs of this model?

Yes—NDEs, past-life memories, children's intuitions, and quantum consciousness theories can all be seen as supporting evidence.

Q8: Is this similar to the Simulation Hypothesis?

It has similarities, but here the "soul" is not external—it is the very field we exist within.

Q9: What about heaven and hell?

They can be seen as different processing environments—states of consciousness after "uninstall" (death), depending on accumulated data.

Q10: Does this deny God?

Not at all. It emphasizes that the unified soul is the same absolute truth that religions call "God."

Q11: Where do religions fit here?

Religions are different interfaces for connecting to the source. None are complete or incomplete—they are simply tools leading to the same

outcome.

Q12: Why don’t we remember past lives if reincarnation exists?

Because during re-installation, only some core code remains—not all data. These show up as tendencies, skills, or inclinations.

Q13: Does every soul reincarnate?

Not necessarily. Some evolve to higher versions, some remain stored in the central memory, and some don’t restart.

Q14: What does spiritual evolution mean here?

Each re-installation gathers more data, enriching the unified soul. Personal evolution becomes part of collective evolution.

Achievements of Expanding This Hypothesis

1. Unity of Thought and Spirit – All differences (religion, culture, race) are only variations of software.

2. End of Religious and Racial Wars – Beliefs become recognized as parallel tools, not weapons.

3. Unified Human Goals – Individual goals align with collective progress.

4. Lasting Peace – A natural result of shared awareness.

5. Transition from the 3rd to the 5th Dimension – From material limitation and separation to light, absolute awareness, and unity.

In one sentence:

This hypothesis could become not just philosophy, but a common language for peace and human transformation.

Manifesto of the Unified Soul

We—humans and all beings—do not live separate from one another,

but within a single, unified soul—

a soul that is the infinite source of awareness and absolute knowledge.

This new understanding reveals:

Religious, racial, and cultural differences are only varied paths to one truth.

Wars and conflicts are illusions of separation, not reality.

Every individual is part of a greater whole; to harm another is to harm oneself.

By embracing this unity:

Lasting peace will prevail.

Individual and collective goals will align.

Humanity will be ready to transcend the third dimension (separation and fear) into the fifth (light and absolute awareness).

This manifesto is a call to return to the source,

to build a united, conscious, and enlightened world,

a world where humans are not tools of war—

but architects of peace.

Conclusion

The perspective outlined in this article—rooted in lived experience, intuition, and practical testing—introduces a new paradigm:

The soul is not within us; we exist within the soul.

All beings and phenomena are part of a unified field of consciousness and energy.

By aligning with this field, one can guide minds, transform circumstances, and even rewrite reality.

This vision heralds a future where free will, awareness, and evolution take on profound new meanings.

Unlike previous philosophical or religious doctrines, this discovery opens the door to an entirely new epoch of human thought: one in which humanity recognizes itself not as a bearer of soul, but as a dweller within the One Unified Soul of Existence.

The soul is not inside us; we are inside the soul.
